

# Introduction to PYTHON

## Module 1 / Lecture-1

**By: Atul Kumar Uttam**

Assistant Professor

Computer Engineering & Applications Department,

GLA University, Mathura

# Lecture-1 Topics

- About Python
- History
- Python Version
- Features of Python
- How to execute Python Program

# About Python

- **Guido van Rossum**
- First released in the early 1990s.
- Its name comes from a 1970s British comedy sketch television show called ***Monty Python's Flying Circus*** .

# History

- It was developed in **National Research Institute for Mathematics and Computer Science** in the **Netherlands**.
- Python is derived from many other languages:
  - ABC
  - Modula-3
  - C
  - C++
  - Algol-68
  - SmallTalk
  - Unix shell and other scripting languages.

# Python Version

- Python 1.0 was released in November 1994.
- In 2000, Python 2.0 was released.
- Meanwhile, Python 3.0 was released in 2008.
- Python 3 is not backward compatible with Python 2.
- **[Python 3.11.0a5 is available](#) (2022-02-03).**

# Python 2 vs. Python 3

- Python 2 uses **print** as a statement and used as ***print "something"***
- Python 3 uses **print** as a function and used as **print("something")**
- Python 2 uses the function ***raw\_input()*** to accept the user's input.
- Python 3 uses **input()** function
- In Python 2, the implicit string type is ASCII, whereas.
- Python 3, the implicit string type is Unicode.
- Python 2 uses **xrange()** function which returns a xrange object that works similar to Java iterator.
- Python 3 **range()** returns a list for example the function **range(0,3)** contains 0, 1, 2.
- There is also a small change made in Exception handling in Python 3. It defines a keyword **as** which is necessary to be used.

# Features of Python

## **Python is Interpreted:**

- Processed at runtime by the interpreter.
- Do not need to compile your program before executing it.

# Features of Python...

## **Python is Interactive**

- You can actually sit at a Python prompt and interact with the interpreter directly to write your programs.

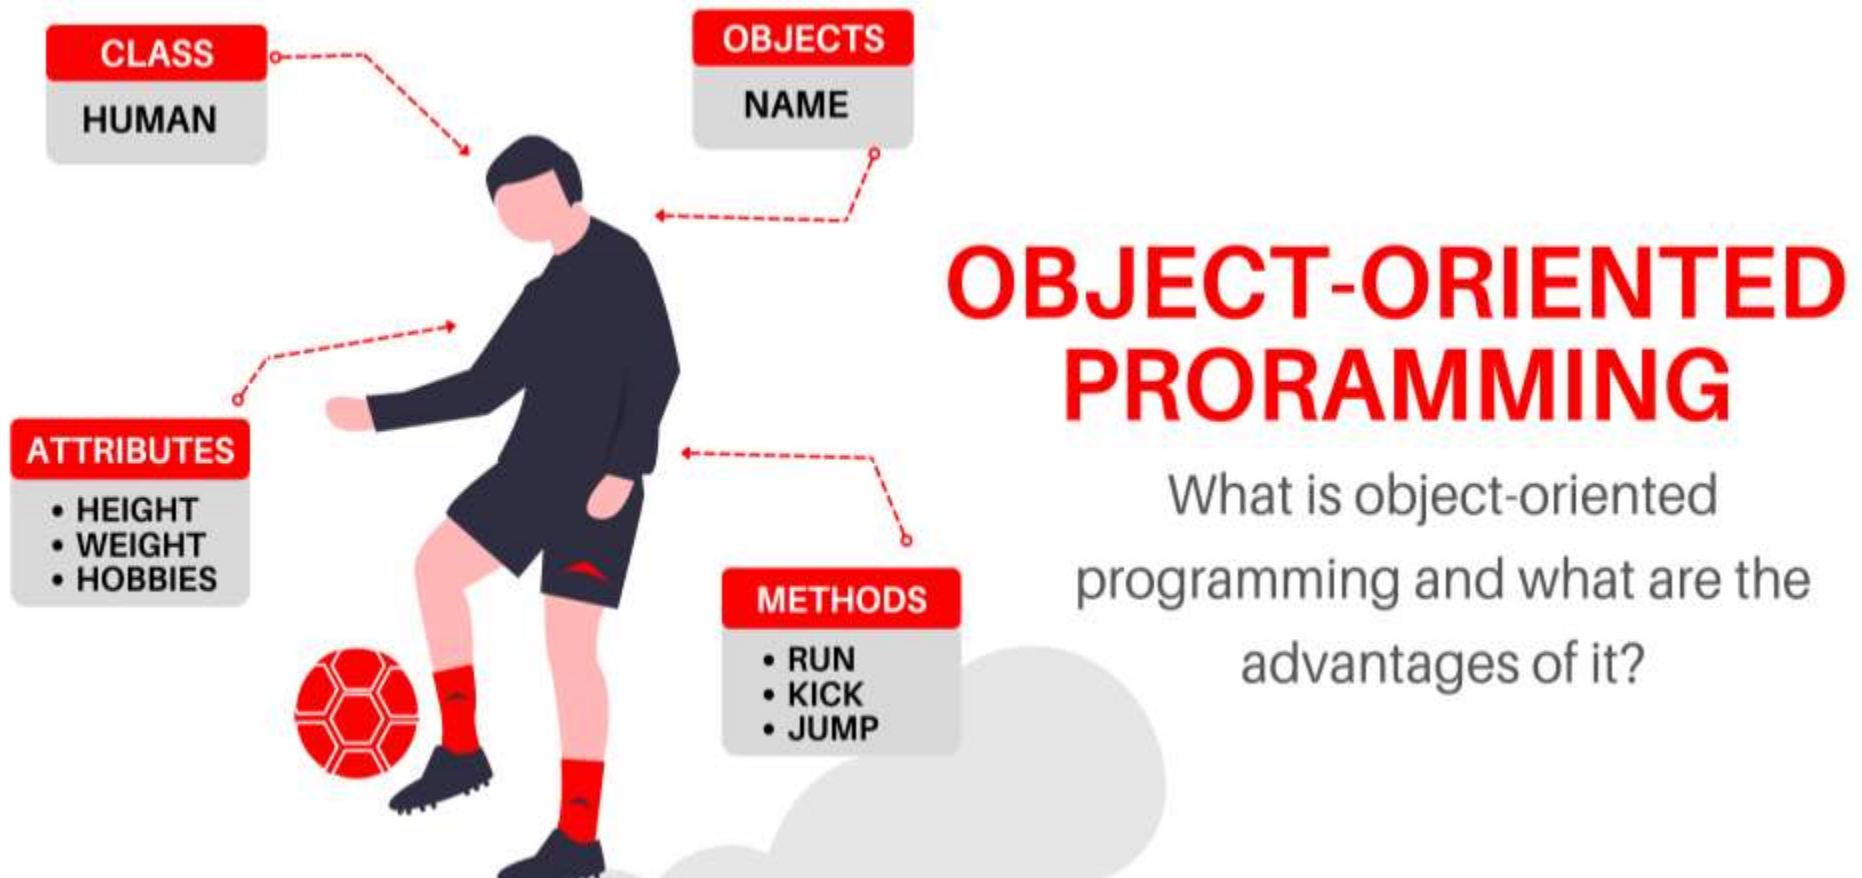

```
>>>2+3
```

```
5
```

# Features of Python...

## Python is Object-Oriented

# Features of Python...

## **Python is a Beginner's Language**

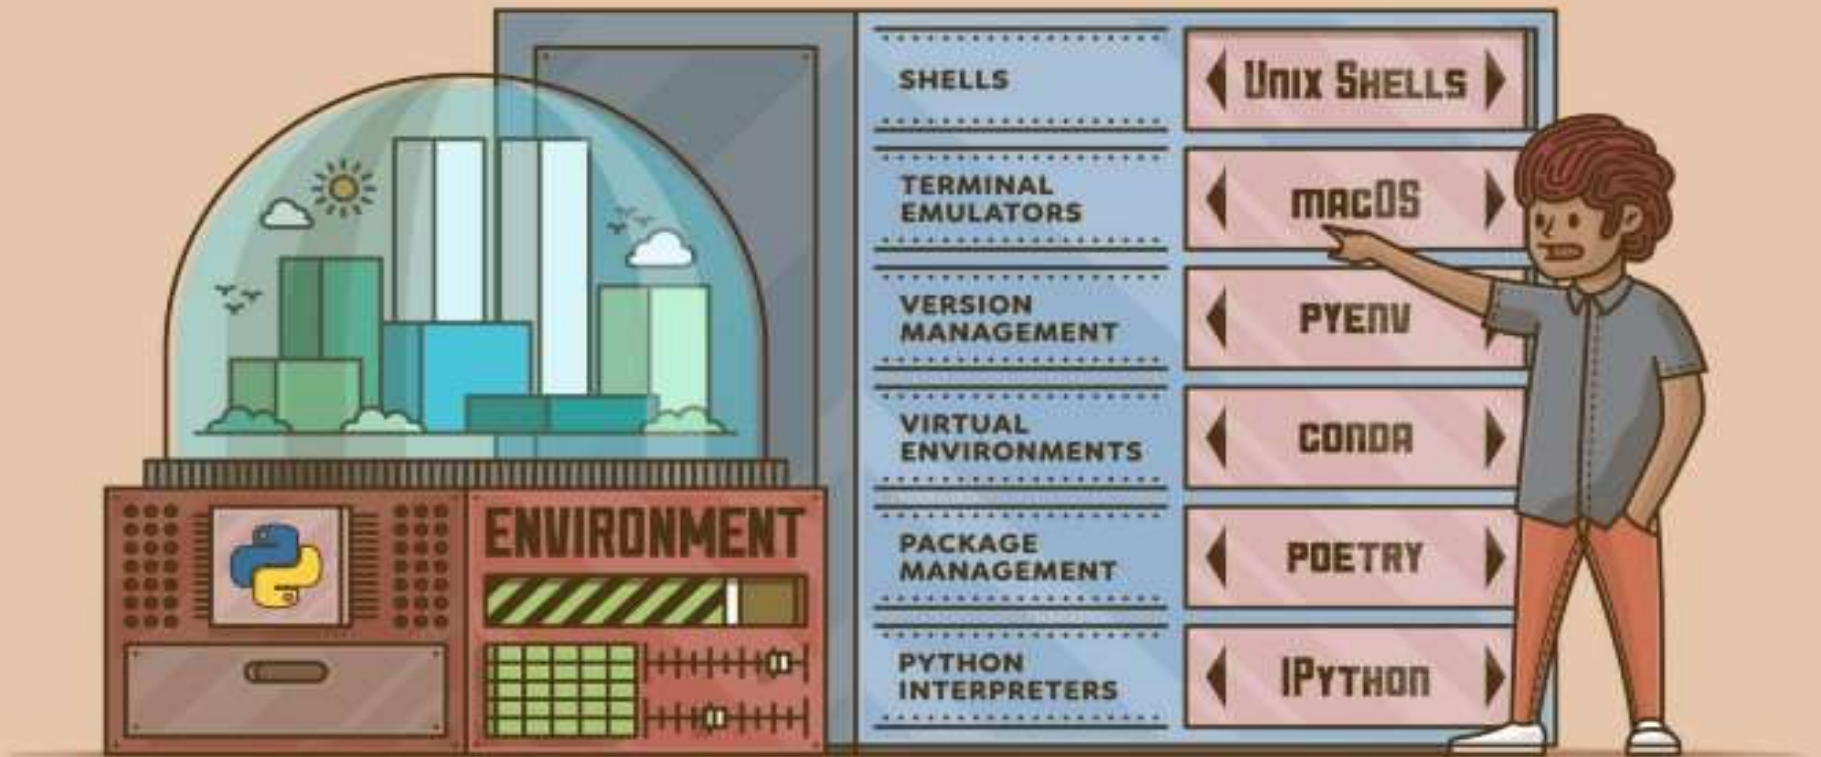

# Features of Python...

## **A broad standard library**

# Features of Python...

## Portable

Real Python

# Features of Python...

## Databases

- Python provides interfaces to all major commercial databases.

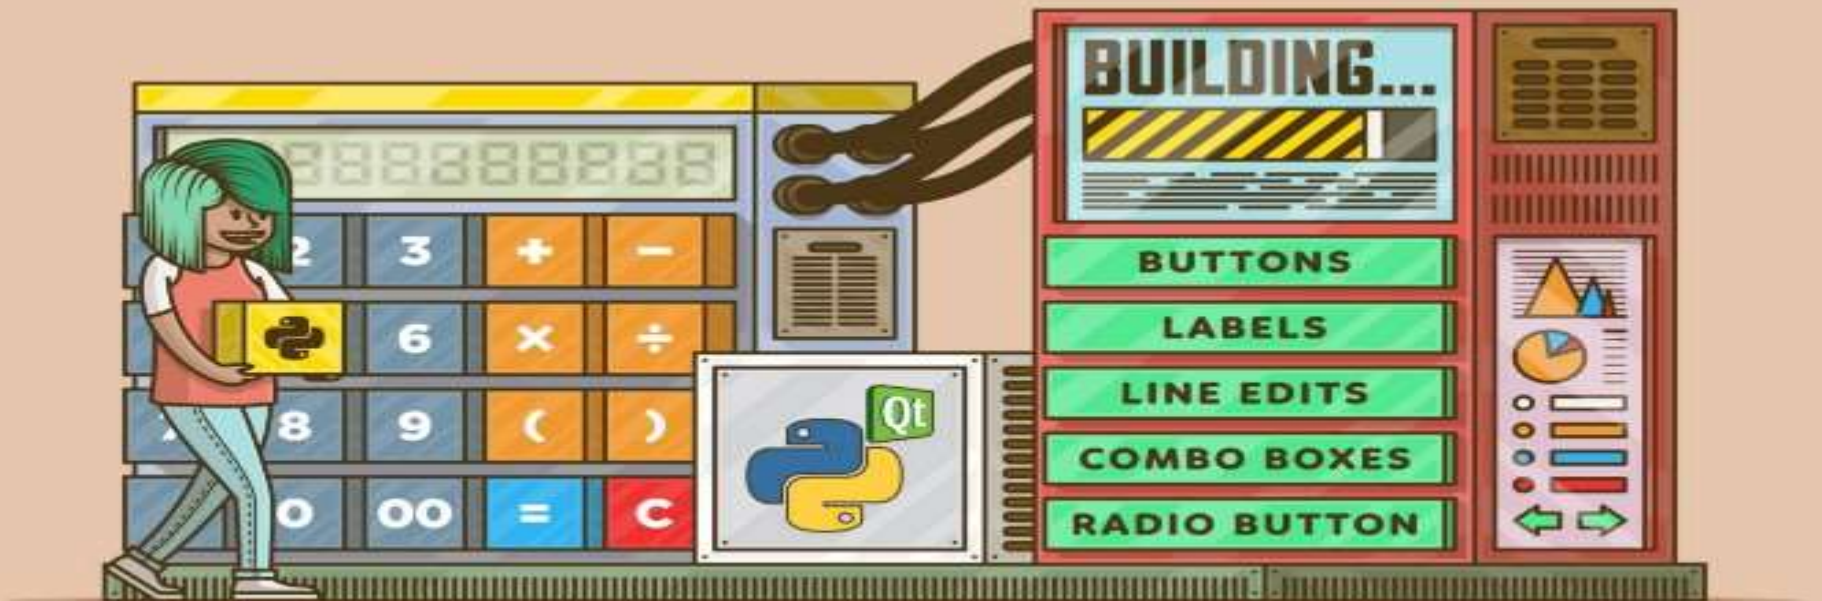

# Features of Python...

## GUI Programming:

- Python supports GUI applications that can be created and ported to many system calls, libraries and windows systems.

# Features of Python...

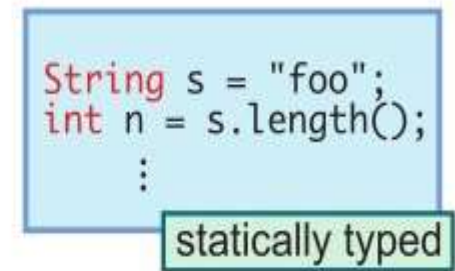

## Dynamically Typed Language:

- Does not require the declaration of type of a variable.
- **Python** interpreter does **type** checking only as code runs, and
- The **type** of a variable is allowed to change over its lifetime.

```
>>> a = 10
>>> type(a)
int
>>> a = "Hello"
>>> type(a)
str
```

⊕ flexible

⊕ reliable

# Python Applications

## 1. Web and Internet Development

- Frameworks such as **Django** and **Pyramid**.
- Micro-frameworks such as **Flask** and **Bottle**.
- Python's standard library supports many Internet protocols:
  - **HTML** and **XML**
  - **JSON**
  - **E-mail processing**.
  - Support for **FTP**, **IMAP**, and other Internet protocols.

## 2. Scientific and Numeric

- **SciPy** : collection of packages for mathematics, science, and engineering.
- **Pandas** : data analysis and modeling library.

### 3. Desktop GUIs

- The **Tk** GUI library is included with most binary distributions of Python.
- Some toolkits that are usable on several platforms are available separately:
  - **wxWidgets**
  - **Kivy**, for writing multi-touch applications.
  - **Qt** via **pyqt** or **pyside**

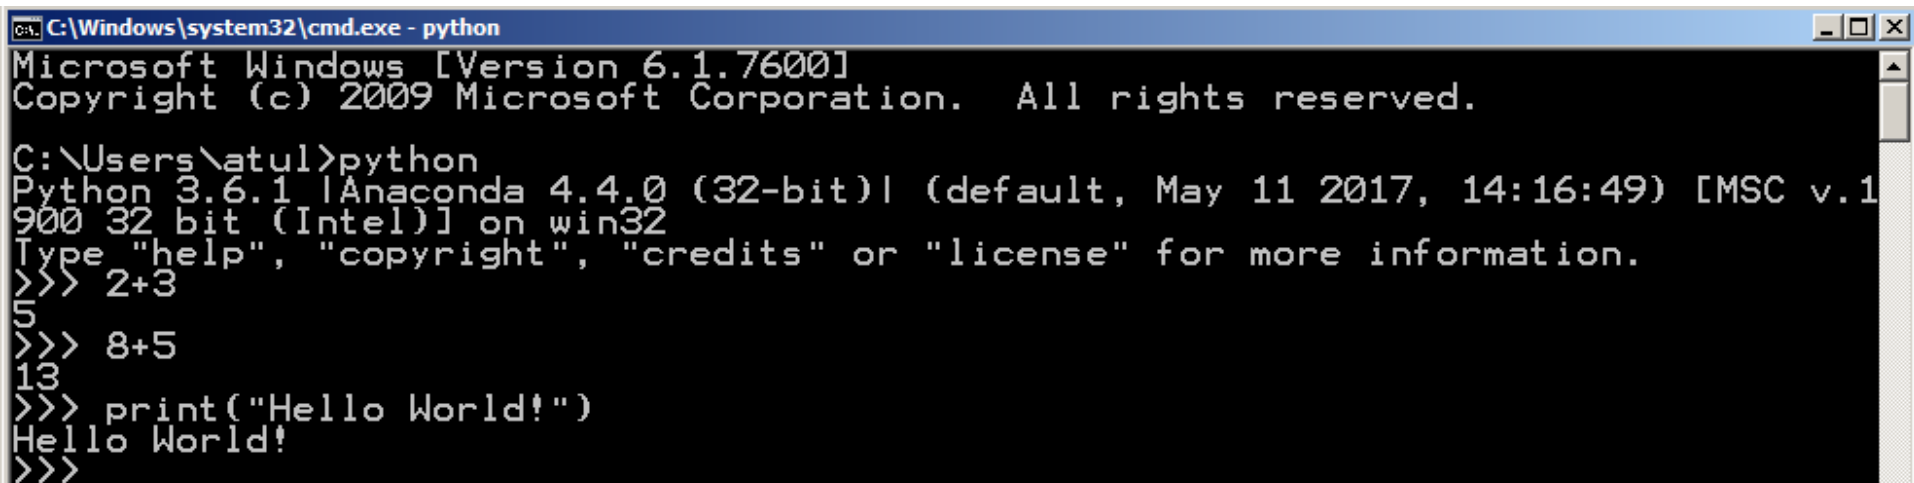

## 4. Software Development

- Python is often used as a support language for software developers, for build control and management, testing, and in many other ways.
  - **SCons** for build control.
  - **Buildbot** and **Apache Gump** for automated continuous compilation and testing.
  - **Roundup** or **Trac** for bug tracking and project management.

# Executing Python Program

## 1. Using Interactive interpreter prompt

- The “>>>” indicates that the shell is ready to accept interactive commands.

A screenshot of a Windows command prompt window titled "C:\Windows\system32\cmd.exe - python". The window shows the output of running the 'python' command. It displays the Python version (3.6.1), the Anaconda environment (4.4.0), and the system architecture (32-bit Intel). It then shows the interactive prompt '>>>' being used to execute several commands: '2+3' (output: 5), '8+5' (output: 13), and 'print("Hello World!")' (output: Hello World!). The prompt '>>>' is shown at the end of the last line.

```
C:\Windows\system32\cmd.exe - python
Microsoft Windows [Version 6.1.7600]
Copyright (c) 2009 Microsoft Corporation. All rights reserved.

C:\Users\atul>python
Python 3.6.1 |Anaconda 4.4.0 (32-bit)| (default, May 11 2017, 14:16:49) [MSC v.1
900 32 bit (Intel)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> 2+3
5
>>> 8+5
13
>>> print("Hello World!")
Hello World!
>>>
```

# Executing Python Program

## 2. Using a script file:

- In script mode, write your code in a text file
- Then save it with a .py extension which stands for "Python".

**OR**

- In windows goto standard Python shell,
- click "File"
- then choose "New" or simply hit "Ctrl + N"
- a blank script file will be open
- write your code.
- press "Ctrl + S" to save it.
- run it by clicking "Run" then "Run Module" or simply press F5.

## Python Shell

File Edit Shell Debug Options Windows Help

Python 3.2 (r32:88445, Feb 20 2011, 21:29:02) [MSC v.1500 32 bit (Intel)] on win32

Type "copyright" for more details

>>> print (

Hello world

>>> print (

Here are th

>>> for i in

print

0 1 2 3 4 5

>>>

\*Untitled\*

File Edit Format Run Options Windows Help

```
print ("hello world")
```

```
print ("Here are the ten numbers from 0 to 9")
```

```
for i in range(10):
```

```
    print(i, end=' ')
```

```
print ("I'm done")
```

**“Hello World”**

**>>>print(“Hello World !”)**

**Hello World !**

# Basics of PYTHON

```
print ("Hello")  
print ("World")
```

**Output 1:**

Hello  
World

**Output 2:**

HelloWorld

# Basics of PYTHON

```
print ("Hello", end=" \n ")  
print("World", end = "\n")
```

**Output :**

Hello  
World

# Basics of PYTHON

```
print ("Hello", end="")  
print("World", end = "\n")
```

**Output :**
